The N-terminal peptide region preferably lacks the first 15-40 residues of native P.aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled-coil moiety in the coding sequences. The modified protein thus lacks a critical alpha-helical forming portion. This prevents dilgomerisation of pilin protein necessary for attachment to the host cell during infection. The ligated plasmid DNA was transformed into an expression host. The modified all a protein is transformed into an expression host.
The present sequence is the modified KB7 pilin protein from P.aeruginosa. The N-terminal peptide region preferably lacks the first 15-40 residues of native P.aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosi patients, burn patients, and severe neutropenic patients.

(first entry)

The present sequence is the modified PAO pilin protein from P.aeruginosa. The N-terminal peptide region preferably lacks the first 15-40 residues of native P.aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled-coil molety in the coding sequences. The modified protein thus lacks a coil molety in the coding sequences. The modified protein thus lacks a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       that effect the desired deletion, modification or insertion of a coiled-coil moiety in the coding sequences. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection the ligated plasmid DNA was transformed into an expression host. The

                                                                                                                              The present sequence is the modified PAK pilin protein from P.aeruginosa. The N-terminal peptide region preferably lacks the first 15-40 residues of native P.aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled-coil molety in the coding sequences. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection The ligated plasmid DNA was transformed into an expression host. The
                                                                              modified pilin protein is useful in treatment and prophylaxis individuals at risk of Pseudomonas infection, e.g. cystic fib

                                                                                                                                                                                                                                                                This sequence is the C-terminal amino acid sequence of pilin from the P. Deruginosa strain Pl, one of 10 strains which were investigated. The Pl peptide is classified in a group with C-terminal peptides containing 19 residues from Cys to Cys and is cross-reactive with surface peptides in certain bacteria and fungi. The peptides bind specifically to pulmonary epithelial cells. See also AAR25828 and AAR25900-R25908.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          C-terminal portion of Pseudomonas aeruginosa pilin protein useful as a vaccine against non-Pseudomonas cross-reactive microorgan \mbox{\rm TMS} for preventing bacterial and fungal infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pseudomonas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Strain P1; pulmonary epithelial cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides a peptide vaccine against P. aeruginosa that comprises a pilin peptide conjugated to a carrier protein. The pilin peptide has one of the four sequences selected from AAY49352-355. The vaccine is used to prevent Pseudomonas infections. The present sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               P.aeruginosa E coil-truncated PAO pilin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to monoclonal antibodies PK99H and MCA1. The Exos derived peptide has the ability to block binding of P. aeruginosa to buccal epithelial cells by blocking a cell surface receptor. It is homologous to known adhesion domains in the P. aeruginosa pilin protein, esp. the region 131-143. These peptides may be used in vaccines to provide active immunisation against infection by P. aeruginosa or related organisms. They can also be used for targetted drug delivery to pulmonary epithelial cells, e.g. for treating carcinoma they are coupled to photoactivatable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Modified PAO pilin protein; alpha-helical forming portion; E coil; Exemplary coil; coiled coil heterodimer; host cell-receptor site; Pseudomonas infection; cystic fibrosis; neutropenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14-MAR-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAR86702-08 are peptides which have the same immunoreactivity as the peptide sequence given in AAR86701. These peptides are derived from the provided pilin protein. The peptide of the invention is derived from the excenzyme, ExoS. ExoS is an enzymatic/cytotoxic protein present on the surface of P. aeruginosa enzymatic/cytotoxic protein present on the surface of P. aeruginosa cells. It is also an adhesin. It demonstrates immunospecific binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY44385 standard; Protein; 168

```
The present sequence is the H coil truncated PAO pilin protein from P.aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil homodimer with an identical peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents ollyomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection,

                                                                            cystic fibrosis patients, burn patients, and severe neutropenic
```

Sequence 168 A

The present sequence encodes E coil truncated PAO pilin protein from p, aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil heterodimer with an oppositely charged peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Seudomonas infection.

Claim 1; Fig 3B; 32pp; English.

The present sequence encodes E coil truncated PAK pilin protein from P.aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil heterodimer with an oppositely charged peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein intection. The modified pilin protein necessary for attachment to the host is useful in treatment

                                                                                                                                                                                                                                                                                        pilin protein (PPP) sequence as described by Sastry et al., FEBS Lett. (1983) 151, 253-256. The peptide is able to mimic, immunologically, the conserved antigenic determinant site within a semi-variable region of the C-terminal of the natural PPP. The peptide can be used in vaccines to prevent pseudomonas infection, pref. at 10ug-100mg per dose. Antibodies raised against the peptide can be deserously because the period of the cantal the peptide can be used to assay P. aeruginosa pilus protein and also for passive immunisation. The vaccine can also be in the form of a virus or the control of the cont

               Modified PAK pilin protein; alpha-helical coiled coil homodimer; host cell-receptor cystic fibrosis; neutropenia
                                                     P. aeruginosa H coil-truncated PAK pilin protein.
                                                                            14-MAR-2000
                                                                                              AAY44380;
                                                                                                                 AAY44380 standard; Protein;
                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                       The invention provides a peptide vaccine against P. aeruginosa that comprises a pilin peptide conjugated to a carrier protein. The pilin peptide has one of the four sequences selected from AAY49352-355. The vaccine is used to prevent Pseudomonas infections. The present sequence represents a cell surface binding domain from P. aeruginosa strain Pl.

The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled coil homodimer with an identical peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree mobilisation of host-cell receptor sites. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection.

                                                                                                                    This peptide sequence comprises a surface peptide epitope of Pseudomonas aeruginosa group I strain 1244 pilin. It was identified using the Geysen tethered peptide pin assay in which tethered peptides (12-mers, I residue overlap per peptide) representing the entire pilin primary structure were probed with mouse anti-native 1244 pilus polyclonal sera. The peptide is a potential protective epitope of use in vaccine design. A claimed multivalent vaccine against Gram-negative bacterial (GnB) infections comprises a group of pilin-glycan conjugates of different GnB strains or species.

```

The present sequence is the modified K122 pilin protein from P.aeruginosa. The N·terminal 1-28 residues are deleted from K122 strain pilin protein. The modified protein thus lacks a critical alpha·helical

Composition for treating or preventing Pseudomonas aeruginosa infection comprising pilin protein that can not self-assemble -  $\,$

No. 0.0031; Matches .38; Conservative 18; Mismatches 56; Indels 21; Gaps forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The first five amino acid residues are not native to the K122 sequence, but are derived from an intrinsic coding sequence of the expression vector. The C-terminal residue is the Pro residue immediately upstream of the stop OCH codons. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic patients.
